DETAILED ACTION

Status of Application

Claims 14-27 and 31-40 are pending. Claims 14-24, 36 and 37 are withdrawn. Claims 25-27, 31-35 and 38-40 are presented for examination.

Response to Arguments

Applicant's arguments, see amendment after final, filed 7/9/2010, with respect to claims 25-27, 31-35 and 38-40 have been fully considered and are persuasive. However, upon further consideration, claims 25-27, 31-35, 38 and 39 remain rejected over Glenn for different reasoning.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.

4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Page 3

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

- 1. Claims 25-27, 31-35, 38 and 39 are rejected under 35 U.S.C. 103(a) as being unpatentable over Glenn et al. (U.S. Pat. No. 6235683).
- I. Regarding claims 25-27, 31-34, 38 and 39, Glenn teaches an aqueous surfactant-free suspension and the use of these mixtures for application to plants for protection of the plants from frost (abstract). Glenn teaches the aquesous surfactant-free suspension comprising an organic solvent, water, and a hydrophobic (column 4, lines 52-53), nanostructured particle wherein the particle is less than about 100 microns (note that overlapping ranges are *prima facie* evidence of obviousness, see column 5, lines 47-51), wherein the suspension comprises at least 50.01% by weight of water (see Example 1, treatment 3, column 9), and the hydrophobic particles consist of TRANSLINK 77 (see Example 1, treatment 3, column 9) and may also be other particles with hydrophobicity imparted by a treatment with alkylsilane or with silicone fluids (column 5, lines 5-41, note that these treatments will result in a polymer on the particle,

Art Unit: 1711

the examiner contends that these particles would overlap with applicant's claim of particles selected from polymer particles when given the broadest reasonable interpretation). Glenn teaches preparing this solution by suspending the nanostructure particles in an organic solvent miscible with water and having a boiling point less than 150 °C, and then mixing this with surfactant-free water to form the suspension (see Example 1, treatment 3, column 9). It should be noted that the term nanostructured particle is a broad term and would encompass any ridge or indentation in the nanoscale range on a particle and does not limit the claim to structures having a defined nanoscale texture on the surface of the particle. Glenn teaches that the particles that are preferably used are about less than 100 microns, and these particles, being minerals or treated minerals, would inherently not have a perfectly flat texture and would have imperfections that would correspond to ridges and indentations on the nanoscale range (corresponding to an irregular surface nanostructure with features in the range of 10 to 100 nm), thus reading on the claimed term of nanostructured particle and claim 34. Further, it should be noted that even though product-by-process claims are limited by and defined by the process, determination of patentability is based on the product itself. The patentability of a product does not depend on its method of production. If the product in the product by process claim is the same as or obvious from a product of the prior art, as in this case, the claim is unpatentable even though the prior product was made by a different process.

Glenn further teaches the suspension having 0.1 to 49.9% by weight of methanol (see Example 1, treatment 3, column 9) and at least 60% water (see Example 1, treatment 3, column 9). Glenn also teaches the use of solvents other than methanol, such as acetone (column 8, lines

Application/Control Number: 10/518,533

Art Unit: 1711

44-51) as well as teaching that the solution only consists of water, the nanoparticles and the organic solvent (see Treatment 3 of Example 1, column 9).

Page 5

Glenn fails to teach the particle present in 0.01 to 1% by weight. However, it would have been obvious to one of ordinary skill in the art at the time of the invention that adjusting the concentration of the particulate materials would adjust the amount of particulate material applied to the plant. Furthermore, Glenn makes clear that the amount of particulate material needed varies depending on a number of factors (column 6, lines 20-29). Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to choose the instantly claimed range for the concentration of the particulate material through process optimization, since it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. See In re Boesch, 205 USPQ 215 (CCPA 1980).

II. Regarding claim 35, Glenn teaches all the limitations of claim 25, but fails to explicitly teach that the particles are not agglomerated. However, Glenn does teach that the particles should be finely divided (column 5, lines 47-48). Therefore, based on this teaching, it would be obvious to one of ordinary skill in the art at the time of the invention to modify Glenn's suspension by ensuring that the particles are not agglomerated. One would have been motivated to make this modification as Glenn actually teaches the benefits of the particles being finely divided (see above).

Allowable Subject Matter

Claim 40 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is a statement of reasons for the indication of allowable subject matter:

The prior art of record fails to teach or suggest aqueous suspensions of ptfe in the desired particle size and in the desired concentration.

Conclusion

Claims 14-27 and 31-40 are pending.

Claims 14-24, 36 and 37 are withdrawn.

Claims 25-27, 31-35, 38 and 39 are rejected.

Claim 40 is objected to.

No claim is allowed.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to ROBERT S. WALTERS JR whose telephone number is (571)270-5351. The examiner can normally be reached on Monday-Thursday, 9:00am to 7:30pm EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Michael Barr can be reached on (571)272-1414. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
